Introduction

EVALUATING OPPORTUNITIES

Every brilliant entrepreneurial mindset has a common line that, "My business is different." What does it take to stand out? An Idea which is turned into an Opportunity. An IDEA; that's quite plain, what you do with it, how an idea changes the standards of living, working, innovating and remedy the society; that's an OPPORTUNITY! You can't sell an idea but use it as a stepping stone to the path that leads to the opportunity.

Business is a war, an intellectual sport. What is valued is the way you think and execute that produces the outcome. Those stupid questions that distracts everyone but are actually productive. In the era of entrepreneurs, startups and constant research, it is necessary to evaluate the possibilities. Avoid bad assumptions. What could go wrong? What do you see? What do you know? What are the options to explore? What else can you do?

There is a part of your brain that sets the goal and then there is an entirely different part of your brain that achieves the goal. So, if one assumes a step to be the last one to success, well, think again. It's about strategic growth thinking that works for the long run sustainability. Risk assessment and creating more opportunity out of the opportunity is the thriving vision one should seek.

Importantly, investing time, energy, resources, money in a business one may still fail due to lack of sanity. Sanity is to what thoughts you hold, how much you agree to the process and values you hold towards the development of your business. Overall resulting in evaluating the opportunity, resulting in improved skills, knowledge, ability, connections, network and experiences you grow through.

Edible food packaging: Eat your food and its wrapping too!

The edible food packaging industry is a one-of-a-kind industry with enormous potential in the growing food and pharmaceutical industries. The expanding global demand for biodegradable packaging, the growing processed food market, and the growing innovation in food packaging are all propelling the global edible packaging industry forward. Edible packaging materials have been found to have increased adoption due to increased processed food consumption, increased hygiene issues among people, and an increase in packaging waste due to the use of synthetic polymers, all of which have an environmental impact and thus promote the edible packaging market's growth.

Edible packaging reduces waste and pollution from single-use plastics while also providing a sustainable option for foodservice and delivery container applications. Edible packaging has gained popularity among both producers and customers as a result of growing worries about single-use plastics and the possibility of their prohibition.

Edible packaging market Growth and Forecast (2021-2026)

The global edible packaging market was valued at $727.6 million in 2021 and is expected to grow to $1.1 billion by 2026, with a compound annual growth rate CAGR of 6.2 percent. Over the same time period, the worldwide edible packaging industry is expected to increase.

The plant segment is expected to increase at a CAGR of 4.6% in 2019-2026

Plant and animal segments make up the source segment. With sales of $ 340.08 million in 2018, the Plant category emerged as the market leader in the global Edible Packaging market, and is predicted to rise at a CAGR of 4.6 percent in 2019. Advances in plant sources for edible packaging have also benefited manufacturers' prospects and led to an increase in output of the same.

The pharmaceutical segment is anticipated to grow at a CAGR of around 4.7% in 2019-2026

Food, beverages, and pharmaceuticals are all part of the end-use category. Since edible packaging is predominantly utilized in the pharmaceutical industry for the packaging of capsules, the pharmaceuticals category is expected to develop at the highest CAGR of roughly 4.7 percent over the projected period. Growing global health awareness has boosted pharmaceutical and nutraceutical markets all over the world, which is likely to raise product demand in the foreseeable term.

The seaweeds and algae segment is expected to grow at a CAGR of around 4.9% in 2019-2026

Seaweeds and algae, polysaccharides, and lipids are included in the raw material category. Because seaweed and algae have emerged as prominent sources of raw material in the manufacture of edible packaging items, the seaweed and algae segment is expected to develop at the highest CAGR of roughly 4.9 percent throughout the forecast period. Seaweed's intrinsic characteristic as a nutrient-dense food source further encourages its use in packaging applications without the use of extra chemicals. Commercial seaweed farming in Asia-Pacific countries has also aided the industry in obtaining sufficient raw material inputs and is seen as a long-term solution to meet industry packaging needs.

Not if, But Who

Packaging is a multibillion-dollar food sector that is about to undergo huge changes in the next few years. With so many firms, technology, and investors fighting for a piece of the packaging pie, the question isn't if a renewable company will take over the industry, but who it will be.

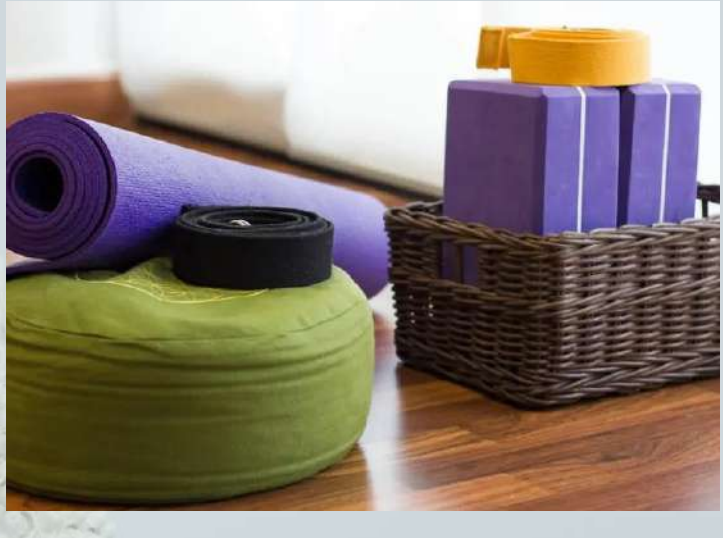
Spirituality as a new business model

In early 2020, COVID-19 started to spread worldwide. Everything was shut down; people were unable to go to their offices, to the gym, to cafes, etc. The world has started to turn into an online platform. After a few months, everything started functioning, except for gyms or fitness centers.

June 21, apart from being the longest day of the year, has been designated as International Yoga Day by the United Nations. Many people rediscovered yoga as a sacred practice of spirituality and health after COVID-19. People started practicing yoga in the comfort of their homes. They started to attain health benefits as well as psychological benefits.

Yoga props (yoga blocks, mats, pillows, and belts) were founded by B.K.S. Iyengar in 1970, but western culture gave them a boom. These props help practitioners improve their posture and flexibility. Props help to deliver faster results by improving strength and flexibility. Yoga props are utilized in postural yoga to help with accurate alignment in an asana, for ease in mindful yoga exercise, to allow poses to be held for longer periods in Yin Yoga, where help may allow muscle groups to loosen up, and to enable people with a restricted motion for any purpose, inclusive of stiffness, damage, or arthritis. The yoga prop industry is flourishing.

For entrepreneurs, it is a prodigious opportunity to start this demanding business.



A few important things that an entrepreneur should know:

1) Creating good and quality products:
- Products with a long life
- Eco-friendly products

2) Good promotional strategy and tie-ups with yoga institutes:- Rishikesh is a world-famous yoga destination. It is called the "World Capital of Yoga". Making tie-ups with institutions will result in good product promotions.

3) Stay financially stable and believe in yourself.
- Separation between your personal finances and the corporate finances
- Maintain proper debt to equity ratio
- Believing in your capabilities

Hand To Handlooms

Indian handloom portrays our rich culture and legacy as well as depicts the creative mind and experience of craftsman's cut on a fresh start. Indian handloom has gone through enormous transformation as far as development and modernization. Today, the handloom area is viewed as one of the biggest sloppy areas after farming and structures, a basic piece of the rustic and semi-country occupation.

Handloom weaving includes one of the most innovative and most artistic parts of the Indian social legacy. Handloom is known for adaptability, flexibility and ingenuity. The highlight of handloom lies in the authenticity of presenting new plans, which cannot be imitated by the Power loom area. The upsides of the area incorporate less capital escalation, utilization of negligible power, eco-accommodating quality, adaptability of little creation and versatility to advertise prerequisites. It is a characteristic useful resource and custom at house level, which has been supported and developed by move of expertise from one age to another.

The biggest effect on the handloom business would be the capacity to support the market requests. With Indians multiplying from one side of the planet to the other, and with the entire world turning out to be a greater number of handloom clients, the Indian web based business Industry is the response to making handloom accessible to each insightful client's entryway step.

Right now, the online business and actual retail space for handlooms is somewhat divided, with no genuine single large player claiming the space. This would mean two things – the business and the economic situations have adequate room for some little players to assemble their speciality and develop, and the union is sure to occur in 2-3 years' time.

Turning E-Waste to E-Cash

Increasing demand for the latest electronic gadgets leaves a trail of e-waste that is fast becoming an environmental concern in many countries. Traditional disposal methods, such as landfills, are harmful due to the non-biodegradable nature of the plastics and metals that constitute printed circuit boards. Advancements in waste processing methods enable start-ups to segregate and repurpose e-waste into useful products in a safe and environmentally-friendly way.

Mining for precious metals, gold, and silver from used electronics is one of the methods of recycling e-waste that also reduces the pressure on virgin mining at the same time. The urban mining potential in electronic waste from underdeveloped regions provides immense benefits for the community as a whole. Start-ups take on social projects to help struggling communities by converting e-waste into recycled products.

Refurbishing involves the identification of the various components that are in working condition in order to use them in new products. There is significant potential for reusing electronic components, in working condition, of any discarded electronic product. Refurbished electronics are comparatively cheaper to new products and reduce the carbon footprint of consumer electronics manufacturing. Start-ups provide sustainable refurbishing services that contribute towards a greener planet.

Companies are increasingly moving their data storage to the cloud due to the high costs of hardware required for maintaining on-site data centres. Decommissioned data centres involve complexities in terms of the physical shutdown of electrical systems and systematic destruction of data. Start-ups provide data centre decommissioning services, including IT asset disposition, recycling, and reuse of electronic hardware.

The Empowerers

Personal care as an industry is growing immensely in India nowadays. Albeit, the trend of taking care of skin arrived late in India but it is creating a huge impact. Personal care includes skincare, makeup, fragrances, bath, and oral care but skincare and makeup are dominating the Indian market.

It is perspicuous that small startups are gaining popularity with Indian consumers especially those entrepreneurs who are focusing on creating corporate social responsibility.

In present days, the Indian personal care products created by startups are gaining a large market share and with the ongoing digital revolution, these startups are catching the spotlight and leaving behind the big giant companies.

It is challenging for emerging entrepreneurs to set the business apart from rival businesses and portray a better figure for future years. Therefore, the main aim of these small startups is to create an impact for the long run, and focusing on social responsibility can wisely win consumers' attention.

There are a lot of niche startups that focus on eco-friendly and affordable personal care products. Not only this, but they also focus on chemical-free based products. Lately, people are much aware and keen regarding the products they are using. With the growing generation, consumers are becoming more aware and demanding natural products for self-enhancement.

A range of beauty products free from sulphates and parabens, organic products, products that are eco friendly, vegan, and cruelty-free products are primary focuses of many young and small entrepreneurs.

There are few startups that focus on Ayurveda roots, which creates a balance between providing skin with natural nourishment and keeping the environment safe by using paper packaging and glass containers with less use of plastics.

So, switch to beauty products that are more promising because sustainable beauty means sustainable earth. As a consumer, if we support these entrepreneurs we are indirectly contributing to a healthier and happier environment.

A little contribution can do wonders so can we pledge to buy from emerging and eco-friendly start-ups every time we think of purchasing personal care products?
