MODERN DEFENSE

Technologies and Global Security

INTRODUCTION

THE MORE YOU SWEAT IN PEACE, THE LESS YOU BLEED IN WAR

The battle-famous phrase above emphasizes the need for peacetime military practices to lower attrition rates during wartime. Optimized military practices can be achieved only through modern and better state-of-the-art military equipment. Since the previous century, many nations have been endorsing and sponsoring defence firms that cater to the needs of the present as well as future conflicts.

Lockheed Martin's B-2 bomber and F-35 have been the crown jewels of the United States' national security. Pacing up with regional threats, Russia's S400 missile defense has championed the field of multilayer aerial threat protection. Similarly, Europe, China, India, Korea, and many other countries have started developing defense technologies that suit their geopolitical needs and line of defense. The companies developing this equipment are not only safeguarding the nations but also generating mass employment and enormous revenues for their countries. The conflict scenario has changed a lot in the last half a decade, with satellite-guided missiles being used in the Israel-Palestine faceoff, Unmanned combat aircraft in the Russia-Ukraine war, and an Integrated Missile cover system in the latest India-Pakistan standoff post Pahalgam Attack.

The multinational defense megacorporations are investing tremendous funds in developing cutting-edge technologies and equipment that set them apart and enhance their presence in the market. These corporations are also promoting and assisting the defense startups that are not only manufacturing the latest generation equipment but are also devising ways to lower the cost and elevate the quality of military products.

DEFENDING THE SKIES:
RAFAEL'S IRON DOME IN ACTION

In the era of emerging security conflicts, country's advanced technology in defence sector plays a major role in today's modern challenges. Advanced and modern technologies have the capability to strengthens our country's defence capabilities. The defence system itself becomes more powerful with modern equipment and innovations. One of the most prior examples is Israel, who presents itself as a significant nation in Middle Eastern politics and technology development. The country further demonstrated its strong economic growth through its advanced industries and strategic regional position.

Talking about Israel's Rafael Advanced Defence Systems Ltd. which is equipped for designing military equipment and weapons for defence purposes. The company unambiguously focuses on developing advanced technology solutions for armed forces and security applications. Iron Dome functions as air defence technology that ceases rockets and missiles in the sky before they hit targeted area on ground. Today's security situation is actually changing very rapidly, and advanced technology definitely plays a vital role in protecting our country than before. Countries in modern wars are focusing more on investing in systems that not only protect their civilians but also important infrastructure of the nation. These systems are designed artificially not only to stop threats but also save lives during conflicts.

Israel's Iron Dome system stands as an remarkable example of this technology. Rafael Advanced Defence system has an impressive success rate- intercepting over 90% of incoming missile during time of conflict, making it as an advanced air defence technology which possess the potential to set new standards for the world.

The Iron Dome is innovated and designed to intercept short-range rockets, artillery shells, and mortars. As per the system design, the radar and interceptor missiles can detect incoming threats within seconds and calculate their path. Regarding populated areas, it can eliminate threats heading toward these locations. In recent wars it has been proven that the Iron Dome has demonstrated its strategy by becoming a cornerstone of Israel's defence strategy during any situation of crisis.

As current events unfold in the latest development of battlefield "The Middle East" conflicts are continuing further, and the Iron Dome itself plays a decisive role in these situations. The system actually provides real-time protection from air attacks, which definitely makes Israel's defence stronger. This protection actually helps civilians feel more confident and definitely allows the country to stay stable during difficult times.The system further shows how global defence is relying more on artificial intelligence, radar precision, and automated defence mechanisms itself. Basically, when countries face threats like drones and cyber-attacks, technologies like Iron Dome exhibit how innovation can shift the balance toward the same goal of security and peace.As per changing conflicts, defence companies and governments must work together regarding new advanced systems to keep national defence strong and ready for future challenges

Globally, Israel's Iron Dome from Rafael Advanced Defence Systems highlights a broader shift as the country shows how advanced defence technology can change modern warfare scenario. It is a reminder that innovation with amalgamation of artificial intelligence together can prove to be the strongest ally for nations security. Israels dome is not just a shield for one nation but created a significance impact and become a model for other countries to follow in defence innovation.

MQ-9B PREDATOR:
THE WORLD'S MOST ADVANCED COMBAT DRONE

The MQ-9B Predator, made by General Atomics Aeronautical Systems (GA-ASI), is at the top of unmanned aerial vehicle technology. This high-flying, long-endurance drone has changed modern warfare and surveillance worldwide.

The MQ-9B has impressive specs: a 66-foot wingspan, a 36-foot length, and a maximum takeoff weight of 12,500 pounds. It is powered by a 950-horsepower Honeywell TPE-331-10 turboprop engine, reaching speeds of up to 275 mph and flying at altitudes over 40,000 feet. With an exceptional endurance of more than 40 hours and a range of 1,850 kilometers, the drone provides continuous surveillance that outmatches traditional aircraft.

The MQ-9B has nine external hardpoints that can carry various payloads, including AGM-114R Hellfire missiles, GBU-39B laser-guided bombs, and anti-submarine warfare tools. Its advanced sensor suite includes multi-spectral targeting systems, synthetic aperture radar, and thermal imaging that can read license plates from two miles away.

In October 2024, India signed a significant $4 billion deal for 31 MQ-9B drones, which is the second-largest defense purchase from the United States. The Indian Navy will get 15 SeaGuardian variants designed for maritime use, while the Army and Air Force will each receive eight SkyGuardian models. This purchase greatly improves India's surveillance capabilities along contested borders with China and enhances deterrence through early detection.

The MQ-9B's ability to fit into civilian airspace, along with its automatic takeoff and landing features, makes it a vital asset for modern military operations.

LYNX KF41:
RHEINMETALL'S ENTREPRENEURIAL EDGE

Modern warfare is no longer decided only by the size of an army. Success depends on technology that can adjust to fast-changing threats and unpredictable conditions. Defence companies with an entrepreneurial outlook are the ones driving this change.

Rheinmetall AG, founded in 1889 in Germany, has shown how a long-established firm can keep reinventing itself. From its origins in heavy industry, it has grown into a global name in defence innovation, proving that tradition and transformation can work together.

The company's standout creation, the Lynx KF41 Infantry Fighting Vehicle, captures this approach. Designed with a modular system, it can be adapted for different missions such as moving troops, surveillance, or combat operations. This design makes it practical, cost-conscious, and ready for the evolving demands of today's military forces.
Rheinmetall also extends its influence through international collaboration and joint production projects, turning the Lynx into more than just a machine — it becomes a platform for cooperation.
In a world shaped by drones, cyber threats, and precision weapons, the Lynx KF41 underlines a simple truth: in defence, adaptability is not optional — it is essential.

BAE'S ARCHER:
SHOOT, MOVE, SURVIVE

It carries 21 shells, ready to fire standard rounds or punch through armor with specialized ones that hit like hammer on steel. With its "shoot-and-scoot" tactics, the system can hit targets in seconds, then vanish before the dust settles.

The ARCHER, already in use by the Swedish and British armies, has now drawn Switzerland's interest after proving itself in muddy, rain-soaked field trials. Fast, accurate, and built to shield its crew, it ranks among the most powerful mobile artillery systems on the planet, able to hit a target dead-on before the echo of the first shot fades.

BAE Systems' ARCHER is a truck-mounted 155mm howitzer built for speed, automation, and survival, able to roll into position and fire within seconds on today's fast-moving battlefields. Built on a standard truck chassis, ARCHER can switch from rolling down the road to firing its first round in less than half a minute, the metal barrel already lifting toward its target. A fully automated system runs from inside a steel-plated armored cabin, keeping the small crew safe from blasts, hidden mines, and choking fumes. ARCHER can unleash six shots, roll half a kilometer down the road, and have its barrel aimed and ready again within two minutes.

NAVANTIA:
S-80 PLUS CLASS SUBMARINE

Naval warfare are the military operations conducted on, under, or over the sea. Who wins the battle or who is more powerful than the other not only depends on the name of the country, but also on who manufactures the arms required in defending the country. Navantia, a Spanish state-owned shipbuilding enterprise founded on January 1, 2005, Who works on civil and military naval construction, the design of deep tech systems, and is also a manufacturer of structures for the renewable energy sector. The best of Navantia is the S-80 plus-class submarine, designed and built by Navantia at Cartagena shipyard. It is an advanced, Spanish-built non-nuclear submarine. The first S-80 submarine entered service in November 2023. The submarine was offered to different countries like India, Poland, the Philippines, and Canada.

S-80 is different and more efficient as it promises up to 21 days of submerged endurance, its ability to launch land-attack cruise missiles, and advanced automated platform control, reducing manpower needs and matching nuclear submarine efficiency levels. The range of the S-80 submarine is approximately 5000 miles, which protects a large territory and also is cost-efficient due to the area it covers. With a revenue of 1.53 billion euros, Navantia is one of the largest shipbuilding enterprises in the world. With the different technology and innovation used by the enterprise, it is one of the best in the business and provides its country with the best arms to defend itself.

SPOT:
THE QUADRAPEDAL AID OF MILITARY TECH

Boston Dynamic, an United States of America based company, is a pioneer in the advancement of robotics. The company is well-known for creating machines that move with lifelike agility. Among its various innovations, one such interesting machine is a four-legged robot, Spot.

Spot was originally designed to be used in industrial tasks, however, for a couple years now, Spot has found its way into the military. The U.S.A military has been using Spot for surveillance, reconnaissance and carrying equipment with agility and a scary quietness in areas that are too dangerous for soldiers to venture like active bomb sites. In July 2024, Spot completed 100,000 missions with the U.S.A military.

Spot's agility goes way beyond any robot on the market. It can climb stairs, navigate uneven terrain, get up if it falls down in any position and patrol areas while transmitting real-time data back to operators. It can monitor perimeters and inspect hazardous zones (active radioactive areas) to reduce the risk to human troops.

Robots like Spot are an integral member of military units, working alongside human troops to extend their reach and safety. What makes Spot more remarkable than it is, isn't just what it can do today, but the potential it represents for the future. Though Boston Dynamics has vowed to not use their robots for violent purposes, it is a fine thread that can snap at any time.

For entrepreneurs alike, Spot is more than a robot. It is a glimpse into how imagination, engineering and practical needs converge to shape the future of technology and business.

CONCLUSION

Thus, we have come to the conclusion of this newsletter where we have discussed about various sectors and their equipments like:- S-400 missile system from Almaz-Antey (Russia), Archery artillery system from BAE Systems (United Kingdom), S-80 plus class submarine from Navanatia (Spain), Lynx KF41 Infantry Fighting Vehicle from Rheinmetall (Germany) and Spot, The Agile Quadrapedal Agile Robot from Boston Dynamics (United States Of America). It's amazing how countries today invest in game-changing technologies for defense and industry. For instance, Spain's S-80 Plus submarine, made with the help of BAE Systems, pushes the limits of how long submarines can stay underwater and how quietly they move, giving navies a strategic advantage.

The Russians, through Almaz-Antey, have developed systems like the S-400, which are essential for detecting and intercepting enemy aircraft, missiles, and drones, keeping their airspace secure. Germany continues making waves with the Lynx KF41, an armored vehicle that can be customised for different combat needs, showing how modern warfare is all about flexibility. And don't overlook the advances in robotics, where German companies are building agile robots for factories and hazardous environment, aiming to boost both productivity and safety.

All these examples show how collaboration, innovation and the drive to stay ahead are shaping today's defense and industrial landscape-sometimes in ways that are almost invisible to those not looking closely. It really is an era of constant progress with technology at the heart of it.

PULSE 25' – CHRIST EVENT

Budding Entrepreneurs Forum was invited to participate in Pulse 2025, an event hosted by Christ College, Pune. The event brought together people with creative minds, entrepreneurial spirit, and inventors from colleges across Pune. The first-year members of the Budding Entrepreneurs Forum were given the chance to participate in a bunch of competitions included in the event. The outcome of this was very admirable.

We are pleased to secure 1st Place in the Reel Making Competition, 2nd Place in the Business Pitch Competition - Unwrap Sustainability, 2nd Place in the Digital Poster Competition - Earth's Insta Profile and 2nd Place in the Dance Competition - From Ashes To Green.

We also took part in the Ramp Walk, Elegance in Resilience, a truly special occasion that showcases fashion's power to inspire innovation and sustainability. In order to maximize our exposure, potential, and learning while demonstrating the range and potential of our abilities as a team and as a Forum. Our decision to compete in non-entrepreneur competitions like Dance and Ramp Walk stemmed from a strategic decision to lay our cards right on the table.

Without the platform that the Budding Entrepreneurs Forum offered and the senior members who guided the participants through the entire process, these accomplishments would not have been possible! Through their efforts, the members achieve greatness to learn, create, and take charge. Additionally, the event was not only a test of our creativity and business know-how, but also a time for us to embrace the role of official Budding Entrepreneurs Forum members! It strengthened the resilience and teamwork.

We would like to thank the Budding Entrepreneurs Forum for giving us a platform to be a part of this amazing journey, which represented a true celebration of talent and creativity.

ENTREPRENEURIAL STORY

INDIA'S INTRA-CITY LOGISTICS SUCCESS STORY

> **"MOVING A BILLION DREAMS, ONE DELIVERY AT A TIME"**

The Indian logistics sector has suffered from structural operational inefficiencies for decades, particularly in intra-city logistics for small and medium-sized enterprises. Three entrepreneurs, Uttam Digga, Pranav Goel, and Vikas Choudhary, attempted to solve this problem in 2014 with a tech-enabled, asset-light platform named Porter.

Porter efficiently links customers with regional drivers and vehicles, providing customers with a reliable transportation method to ship their commodities at a reasonable cost and without hassle. From its inception, Porter expanded to reach over 20 Indian cities, serving several thousand micro, small, and medium-sized businesses (MSMEs) and individuals with its services, including mini trucks, two-wheelers, and packers and movers. In 2025, Porter raised $200 million in capital, became a unicorn start-up with a valuation of $1.2 billion, and continued to stay profitable, posting a profit after tax (PAT) of ₹54 crores. Porter attributes the success of the
above to excellent foresight, focusing on a big and unserved need, having a lean organization, and being heavily concentrated on the MSME market —a market that big logistics firms had largely neglected.

Porter's success demonstrates that the use of technology to enhance mobility within a conventional sector can produce efficiency and profitability gains for stakeholders. It is also a demonstration to Indian businessmen about employing a disciplined approach, problem-solving creativity, and scalability of capabilities that can have a positive and meaningful effect for long-term sustainability.
